

THIS IS DRYARN[®], SOMETHING YOU'VE NEVER TOUCHED BEFORE.

The fabric you're holding is made from a microfibre that's unlike any other: it's called Dryarn[®]. If you've never heard of it, that's ok, because it's absolutely new.

We're telling you because you'll soon get to know it: Dryarn[®] is nature's lightest yarn, so light that it floats on water; it is much warmer and stronger than natural or synthetic fibres; it's always dry on the skin and it's completely anallergic.

If you think all this is very interesting, maybe you should read on.

Want to feel really light ?

There really are a lot of arguments in favour of Dryarn[®].

These are just the main ones: the garment you're holding, the fabric you're running your fingers over, is made from the first polypropylene microfibre ever to be spun so finely.

Just think: 10 km of Dryarn[®] yarn weigh only 1 gram.

That's why we say it's nature's lightest yarn: so light in fact that it floats on water. With the same amount of area "covered", this means that Dryarn[®] gives garments a pleasant feeling of lightness: and that means comfort for the wearer, whether it's for sport, even very "technical" sport, or for day-to-day use.

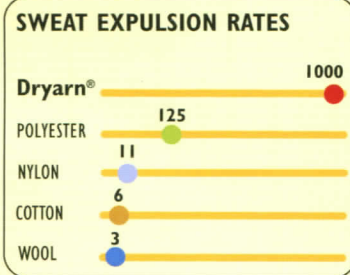

A new concept in comfort.

By the way, do you know why it's called Dryarn[®]? Because it doesn't absorb water and so it always stays dry, giving you a constant feeling of comfort on your skin.

This bit of "magic" is made possible by the microfibre's high surface tension, which ensures that water, damp and perspiration are carried outside the fabric where they can quickly evaporate, or be absorbed by other fibres combined with Dryarn[®].

To give you a clearer idea of what that means, Dryarn[®] does this 167 times better than cotton. But that's not all: its ability to insulate is unique even better than that of wool. So Dryarn[®] is effective at maintaining body temperature to protect the wearer from heat and cold.

Hygiene gets a fresh start with Dryarn[®].

All garments made in Dryarn[®] fabrics guarantee high levels of hygiene. First of all, they can't be attacked by moths, insects or other micro-organisms, secondly, thanks to the microfibre's high surface tension, the yarn won't trap bacteria or mould either. So you get no unpleasant odours, even after intense physical activity. That's some advantage! Dryarn[®] won't absorb stains so they're easy to remove with normal detergents, it is resistant to turpentine, acetone and other solvents used to remove oily stains. It won't attract static or dust. Lastly, it is totally non-allergy producing to the extent that it is recommended for medical use: hospital sheets and pillowslips, curtains, and garments worn by medical staff.

Time won't affect colour, size or appearance.

But Dryarn[®]'s pluses don't end there. Now we're talking about strength: this microfibre stands up to scraping and tearing just as much as nylon and much more than other synthetic and natural fibres. It isn't subject to the ugly "pilling" effect caused by rubbing. It can be exposed to light and heat for long periods without altering. And it can be machine-washed at 90° without any danger of the colours fading because the yarn is hank dyed, which makes them solid and fast.

Dryarn[®] is also very resistant to rubbing, sea water or contact with highly concentrated solvents.

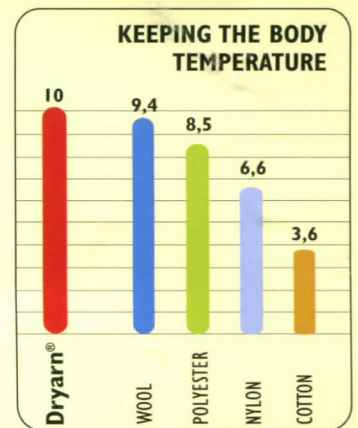

But there's more. After thermofixing Dryarn[®] fabrics stay very stable and any alternations are always below 2%, even after repeated washing. Lastly, this is a self-extinguishing fibre: in other words, if exposed to flames Dryarn[®] fabrics will quench the fire rather than increase it. And that's only one of the reasons Dryarn[®] is used by Italy's military and police forces.

Countless advantages, for countless products.

But there's still one more thing you should know about it: Dryarn[®] is an ecological fibre. Because it's dyed using solid additives, there are no polluting substances from the dying process to be disposed of. And because it's 100% recyclable it can be used subsequently for furniture, car instrument panels, or any other plastic objects in daily use.

So there you have it. All Dryarn[®]'s strong points that make it a totally new and revolutionary microfibre. It is especially suitable for a series of applications that range from knitwear to sport footwear; for fabrics for swimwear, sailing and other water sports, for technical uses such as work shoes,

overalls, gloves and other garments. For men's and women's underwear or for the furnishing sector, in products such as curtains and coverings for sofas and armchairs. In short, an infinite number of applications. And an infinite number of advantages: for anyone who decides to use Dryarn.
